

Employee Directory

This is a small .net employee directory site I reworked.

This housed all the employee contact information. It was very small and later was reworked with Rails.

Get it running:

Unfortunately, the working example requires SQL running on a box. You can rebuild the necessary tables with the edmx files. Right click > Generate Database from Model. From there, add your server name in the web.config in the connection string where it says "yourdatasource".

Issues:

The Table Version folder is a hack up of on page styling. The form version works for viewing however, the editing form will not save. I know why, however a fix was never needed in the time it was live.

Directory Viewer - Tabular Style

Employee Directory						
New Record Run Report						
Find an Employee: <input type="text" value="Han"/>						
Edit Delete	FName	LName	Job Title	Email	Office Phone	Mobile Phone Location
	Han	Yolo	Smuggler	han.yolo@universe.glxy	123-456-7890	Unknown
Employee Directory v1.0						

Directory Viewer - Tabular Style

Employee Directory	
Return to Listing	
Create New Entry	
First Name:	<input type="text"/>
Last Name:	<input type="text"/>
Job Title	<input type="text"/>
Office Phone:	<input type="text"/>
Cell Phone:	<input type="text"/>
Email Address:	<input type="text"/>
Location:	<input type="text"/>
<input type="button" value="Save"/>
